λ_c

(Really it's a PROP, but we're doing Only Topology Matters)

Quaternions (Quick Recap)

Quaternions are a non-commutative real algebra:

Quaternions (Quick Recap)

Quaternions are a non-commutative real algebra:

$$\mathbb{R} + \mathbb{R}i + \mathbb{R}j + \mathbb{R}k$$

Quaternions (Quick Recap)

Quaternions are a non-commutative real algebra:

$$\mathbb{R} + \mathbb{R}i + \mathbb{R}j + \mathbb{R}k$$

$$i^2 = j^2 = k^2 = ijk = -1$$

Unit quaternions and SU2

If we write a unit quaternion as

$$q_w + iq_x + jq_y + kq_z$$

Unit quaternions and SU2

If we write a unit quaternion as

$$q_w + iq_x + jq_y + kq_z$$

then there is a group isomorphism from unit quaternions to SU2:

$$\phi : q \mapsto \begin{pmatrix} q_w - iq_z & -q_y + iq_x \\ -q_y - iq_x & q_w + iq_z \end{pmatrix}$$

Unit quaternions and SO3

If we write a unit quaternion as an angle and a unit vector:

$$\cos \frac{\alpha}{2} + \sin \frac{\alpha}{2} (iv_x + jv_y + kv_z)$$

Unit quaternions and $SO3$

If we write a unit quaternion as an angle and a unit vector:

$$\cos \frac{\alpha}{2} + \sin \frac{\alpha}{2} (iv_x + jv_y + kv_z)$$

then there is a 2:1 group homomorphism to $SO3$:

$$\psi : q \mapsto \text{rotation by angle } \alpha \text{ about } v$$

(q and $-q$ are sent to the same rotation)

Unit quaternions in two different forms

$$(\alpha, \nu) := \cos \frac{\alpha}{2} + \sin \frac{\alpha}{2} (i\nu_x + j\nu_y + k\nu_z)$$

Unit quaternions in two different forms

$$(\alpha, \mathbf{v}) := \cos \frac{\alpha}{2} + \sin \frac{\alpha}{2} (iv_x + jv_y + kv_z)$$

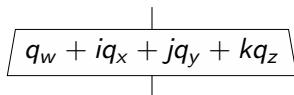

Unit quaternions in two different forms

$$(\alpha, \mathbf{v}) := \cos \frac{\alpha}{2} + \sin \frac{\alpha}{2} (iv_x + jv_y + kv_z)$$

A diagram showing a trapezoidal box containing the text α, \mathbf{v} . A vertical line passes through the center of the box, extending above and below it.

A diagram showing a wider trapezoidal box containing the text $q_w + iq_x + jq_y + kq_z$. A vertical line passes through the center of the box, extending above and below it.

Interpreting q

$$\left[\left[\begin{array}{c} \text{---} \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{ } \\ | \\ \text{---} \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{ } \\ \text{---} \end{array} \right] \right] = \begin{pmatrix} q_w - iq_z & -q_y + iq_x \\ -q_y - iq_x & q_w + iq_z \end{pmatrix}$$

Interpreting q

$$\left[\begin{array}{c} \text{---} \\ \text{||} \\ \text{||} \\ \text{---} \\ q \\ \text{---} \\ \text{||} \\ \text{||} \\ \text{---} \end{array} \right] = \begin{pmatrix} q_w - iq_z & -q_y + iq_x \\ -q_y - iq_x & q_w + iq_z \end{pmatrix}$$

$$\left[\begin{array}{c} \text{---} \\ \text{||} \\ \text{||} \\ \text{---} \\ \alpha, \nu \\ \text{---} \\ \text{||} \\ \text{||} \\ \text{---} \end{array} \right] = \begin{pmatrix} \cos \frac{\alpha}{2} - i \sin \frac{\alpha}{2} \nu_z & -i \sin \frac{\alpha}{2} (\nu_x + i\nu_y) \\ -i \sin \frac{\alpha}{2} (\nu_x - i\nu_y) & \cos \frac{\alpha}{2} + i \sin \frac{\alpha}{2} \nu_z \end{pmatrix}$$

Completeness

ZQ is complete

Completeness

Completeness

Rules of ZQ

So what are the rules?

Rules of ZQ

Z spiders merge

Rules of ZQ

Quaternions multiply

Rules of ZQ

Y reflection / edge reversal

$$q_w + iq_x + jq_y + kq_z \mapsto q_w + iq_x - jq_y + kq_z$$

Rules of ZQ

Negation

$$\lambda_{-1} \begin{array}{c} | \\ \text{q} \\ | \end{array} \equiv \begin{array}{c} | \\ \text{-q} \\ | \end{array}$$

Rules of ZQ

Wire identities

Rules of ZQ

Action on a plus state

$$\begin{array}{c} \circ \\ | \\ \text{q} \\ | \\ \circ \end{array} \underset{A}{=} \lambda_2(q_w - iq_x)$$

Rules of ZQ

Scalars are scalars

$$\lambda_x \lambda_y \stackrel{M}{=} \lambda_{x \times y} \qquad \lambda_1 \stackrel{h}{=}$$

Rules of ZQ

Z phases

Rules of ZQ

Bialgebra

Rules of ZQ

Copy

Let's do that again, without scalars

Let's do that again, without scalars

And identifying $q \sim -q$

Let's do that again, without scalars

And identifying $q \sim -q$

So actually now using $SO3$ not $SU2$

Scalar-free Rules of ZQ

Z spiders merge

Scalar-free Rules of ZQ

Quaternions multiply

Scalar-free Rules of ZQ

Y reflection / edge reversal

$$q_w + iq_x + jq_y + kq_z \mapsto q_w + iq_x - jq_y + kq_z$$

Scalar-free Rules of ZQ

Negation

$$\lambda_{-1} \begin{array}{c} | \\ \square \\ q \\ \square \\ | \end{array} \stackrel{=}{\underset{N}{}} \begin{array}{c} | \\ \square \\ -q \\ \square \\ | \end{array}$$

No longer needed.

Scalar-free Rules of ZQ

Why is it interesting?

Why is it interesting?

- ▶ Physics: Actually uses all rotations of the Bloch Sphere

Why is it interesting?

- ▶ Physics: Actually uses all rotations of the Bloch Sphere
- ▶ Structural: Uses directed edges *and* vertices, not just vertices

Why is it interesting?

- ▶ Physics: Actually uses all rotations of the Bloch Sphere
- ▶ Structural: Uses directed edges *and* vertices, not just vertices
- ▶ Phase algebra: Uses a group larger than $[0, 2\pi)$ (and a non-commutative one at that)

Why is it interesting?

- ▶ Physics: Actually uses all rotations of the Bloch Sphere
- ▶ Structural: Uses directed edges *and* vertices, not just vertices
- ▶ Phase algebra: Uses a group larger than $[0, 2\pi)$ (and a non-commutative one at that)
- ▶ Implementation: TriQ accredits part of its optimisation speedup to its use of quaternions

Full-stack, real-system quantum computer studies: architectural comparisons and design insights (ISCA 2019)

Our work performs a full-stack, benchmark-driven hardware- software analysis of QC systems... We use our toolflow, TriQ, to conduct real-system measurements on seven running QC prototypes from three different groups, IBM, Rigetti, and University of Maryland. Overall, we demonstrate that leveraging microarchitecture details in the compiler improves program success rate up to 28x on IBM (geomean 3x), 2.3x on Rigetti (geomean 1.45x), and 1.47x on UMDTI (geomean 1.17x), compared to vendor toolflows.

Full-stack, real-system quantum computer studies: architectural comparisons and design insights (ISCA 2019)

TriQ composes rotation operations by multiplying the corresponding quaternions and creates a single arbitrary rotation ... Furthermore, on all three vendors, Z-axis rotations are special operations that are implemented in classical hardware and are therefore error-free. TriQ expresses the multiplied quaternion as a series of two Z-axis rotations and one rotation along either X or Y axis, thereby maximizing the number of error-free operations.

Why does it look like this?

Phase algebra

Consider a monoid over states in Qubit

Phase algebra

Consider a monoid over states in Qubit

$$\begin{array}{c} | \\ \square \\ m \\ \wedge \end{array}, \left\{ \begin{array}{c} | \\ \square \\ e \end{array}, \begin{array}{c} | \\ \square \\ a \end{array}, \begin{array}{c} | \\ \square \\ b \end{array}, \dots \right\}$$

Monoid spanning 0 dimensions

If $\left[\begin{array}{c} | \\ \boxed{e} \end{array} \right] = 0$ then because $\begin{array}{c} | \\ \boxed{m} \\ \swarrow \quad \searrow \\ \boxed{e} \quad \boxed{a} \end{array} = \begin{array}{c} | \\ \boxed{a} \end{array},$

Monoid spanning 0 dimensions

If $\left[\begin{array}{c} | \\ \boxed{e} \end{array} \right] = 0$ then because $\begin{array}{c} | \\ \boxed{m} \\ \swarrow \quad \searrow \\ \boxed{e} \quad \boxed{a} \end{array} = \begin{array}{c} | \\ \boxed{a} \end{array},$

$$\left[\begin{array}{c} | \\ \boxed{a} \end{array} \right] = 0 \quad \forall a$$

Monoid spanning 0 dimensions

If $\left[\begin{array}{c} | \\ \boxed{e} \end{array} \right] = 0$ then because $\begin{array}{c} | \\ \boxed{m} \\ \swarrow \quad \searrow \\ \boxed{e} \quad \boxed{a} \end{array} = \begin{array}{c} | \\ \boxed{a} \end{array},$

$$\left[\begin{array}{c} | \\ \boxed{a} \end{array} \right] = 0 \quad \forall a$$

So from here on assume $\left[\begin{array}{c} | \\ \boxed{e} \end{array} \right] = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$

Monoid spanning 1 dimension

If $\text{span} \left\{ \begin{array}{c} | \\ \boxed{e} \end{array} \right\}, \begin{array}{c} | \\ \boxed{a} \end{array}, \begin{array}{c} | \\ \boxed{b} \end{array}, \dots \right\} = \left\{ \begin{pmatrix} \lambda \\ 0 \end{pmatrix} \right\}_{\lambda \in \mathbb{C}}$, then

Monoid spanning 1 dimension

If $\text{span} \left\{ \left[\begin{array}{c} | \\ \boxed{e} \end{array} \right], \left[\begin{array}{c} | \\ \boxed{a} \end{array} \right], \left[\begin{array}{c} | \\ \boxed{b} \end{array} \right], \dots \right\} = \left\{ \begin{pmatrix} \lambda \\ 0 \end{pmatrix} \right\}_{\lambda \in \mathbb{C}}$, then

$$\left[\begin{array}{c} | \\ \boxed{m} \\ \diagdown \quad \diagup \end{array} \right] = \begin{pmatrix} 1 & \cdot & \cdot & \cdot \\ 0 & \cdot & \cdot & \cdot \end{pmatrix}$$

Monoid spanning 1 dimension

If $\text{span} \left\{ \left[\begin{array}{c} | \\ \boxed{e} \end{array} \right], \left[\begin{array}{c} | \\ \boxed{a} \end{array} \right], \left[\begin{array}{c} | \\ \boxed{b} \end{array} \right], \dots \right\} = \left\{ \begin{pmatrix} \lambda \\ 0 \end{pmatrix} \right\}_{\lambda \in \mathbb{C}}$, then

$$\left[\begin{array}{c} | \\ \boxed{m} \\ \diagdown \quad \diagup \end{array} \right] = \begin{pmatrix} 1 & \cdot & \cdot & \cdot \\ 0 & \cdot & \cdot & \cdot \end{pmatrix}$$

$$\left[\begin{array}{c} | \\ \boxed{m} \\ \diagdown \quad \diagup \\ \boxed{a} \quad \boxed{b} \end{array} \right] = \begin{pmatrix} \lambda_a \lambda_b \\ 0 \end{pmatrix} = \left[\begin{array}{c} | \\ \boxed{m} \\ \diagdown \quad \diagup \\ \boxed{b} \quad \boxed{a} \end{array} \right]$$

Monoid spanning all of \mathbb{C}^2

Monoid spanning all of \mathbb{C}^2

Forcing the interpretation

$$\left[\left[\begin{array}{c} | \\ \boxed{m} \\ / \backslash \\ | \end{array} \right] \right] = \begin{pmatrix} 1 & 0 & 0 & x \\ 0 & 1 & 1 & y \end{pmatrix}$$

Unital implies commutative

So in all qubit models of monoids acting on states, that monoid is commutative

Unital implies commutative

So in all qubit models of monoids acting on states, that monoid is commutative

Unital implies commutative

So in all qubit models of monoids acting on states, that monoid is commutative

So we could never represent SO_3 this way

Next time

Aside: This line of reasoning has led to a classification of phase rings acting on states over K -bits, but more on that soon

Conclusion

Conclusion

- ▶ ZQ exists and is complete

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy
- ▶ It reflects the full symmetry of the Bloch Sphere

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy
- ▶ It reflects the full symmetry of the Bloch Sphere
- ▶ It reflects optimisation strategies used in the wild

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy
- ▶ It reflects the full symmetry of the Bloch Sphere
- ▶ It reflects optimisation strategies used in the wild
- ▶ It explores phase algebras beyond $[0, 2\pi)$

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy
- ▶ It reflects the full symmetry of the Bloch Sphere
- ▶ It reflects optimisation strategies used in the wild
- ▶ It explores phase algebras beyond $[0, 2\pi)$
- ▶ It has a different structure to ZW / ZX / ZH

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy
- ▶ It reflects the full symmetry of the Bloch Sphere
- ▶ It reflects optimisation strategies used in the wild
- ▶ It explores phase algebras beyond $[0, 2\pi)$
- ▶ It has a different structure to ZW / ZX / ZH
- ▶ Probably not something to do in your head

Conclusion

- ▶ ZQ exists and is complete
- ▶ The scalar-free version is neat and tidy
- ▶ It reflects the full symmetry of the Bloch Sphere
- ▶ It reflects optimisation strategies used in the wild
- ▶ It explores phase algebras beyond $[0, 2\pi)$
- ▶ It has a different structure to ZW / ZX / ZH
- ▶ Probably not something to do in your head
- ▶ But compilers and proof assistants can implement it just fine

Thank you

Scalar-free Rules of ZQ
